•••10 The position  $\vec{r} = 5.00t\hat{i} + (et + ft^2)\hat{j}$  locates a particle as a function of time t. Vector  $\vec{r}$  is in meters, t is in seconds, and factors e and f are constants. Figure 4-31 gives the angle  $\theta$  of the particle's direction of travel as a function of t ( $\theta$  is measured from

the positive x direction). What are (a) e and (b) f, including units?

•••19 The acceleration of a particle moving only on a horizontal xy plane is given by  $\vec{a} = 3t\hat{i} + 4t\hat{j}$ , where  $\vec{a}$  is in meters per secondsquared and t is in seconds. At t = 0, the position vector  $\vec{r} = (20.0 \text{ m})\hat{i} + (40.0 \text{ m})\hat{j}$  locates the particle, which then has the velocity vector  $\vec{v} = (5.00 \text{ m/s})\hat{i} + (2.00 \text{ m/s})\hat{j}$ . At t = 4.00 s, what are (a) its position vector in unit-vector notation and (b) the angle between its direction of travel and the positive direction of the x axis?
